Victorian Hansard on the 'net

Jon Breukel reports on exciting developments in current political information

Victorian Hansard is now available as a searchable full-text database on the Internet, called *VicHansard*. *Victorian Hansard* was officially launched on the Internet by Victorian Treasurer and Australia's first Minister for Multimedia, Alan Stockdale MLA at the Victorian Parliamentary Library on 5 June.

The full-text of *Victorian Hansard* is available from 1991 onwards in a remarkably easy to use database utilising KE Texpress software developed by Knowledge Engineering. The availability of *Hansard* on the Internet has set national standards which other Parliaments around Australia are keen to follow. Over the years the database has proved extremely useful in locating relevant information quickly and the Internet version will take this one step further. All those with Internet access will be able to access a database which, until now, has only been available to ministers and selected clients.

Users are able to search under specific ministers names, second-reading debates, ad-

journalment and grievance debates, questions on notice, questions without notice, ministerial statements, personal explanations, petitions, papers and business of the house.

VicHansard has been made available on the Internet through the VICNET server located at the State Library of Victoria — click on the Hansard button on the Parliament of Victoria's world wide web home page: <http://www.vicnet.net.au/vicnet/vicgov/parl/parlia.htm>.

Internet access in public libraries

Kirsty Williamson, RMIT

Will some community groups, such as older people, be disadvantaged by the increasing use being made of the 'information superhighway'? A PhD study, I recently completed investigated the information, communication and telecommunications needs of older people. It was an extensive study of the use of sources of information, including the mass media and libraries, as well as of telecommunication use. The study found that there were low percentages of ownership and 'good understanding' of new telecommunications equipment amongst the sample of 202 respondents, aged sixty and over. It also found that many respondents were adamant that there is no role for computers in their lives.

Building on the PhD study, the telecommunications needs research group at RMIT is undertaking a project which focuses on barriers to use of the Internet and/or VICNET in places of public access. The major purpose of the study is to investigate how access to new technology can be improved. The findings of the project will be reported at the ALIA conference in October.

Two age groups are involved: an older group (aged fifty and over) and a younger group (aged fifteen to thirty). The study will investigate the problems people encounter using the Internet within those age groups, and ways of reducing those problems.

Public libraries, which are being funded by both Federal and State governments to provide public access to the Internet, will be the major focus of the study. Three public libraries will be involved — Brighton, Box Hill, and Hamilton. Other public access points, such as cyber- or Internet cafes and telecentres, will be included in order to find out who is already using these access points, what problems exist for present users, and what barriers exist for non-users. The investigation will ask questions such as: how can the software be improved to provide easier access? What can public libraries do to improve access? What training may be needed and how should it be delivered?

The project is being generously funded by the Telstra Fund for Social and Policy Research.
